

Assignment 2: Redesigning a digital experience

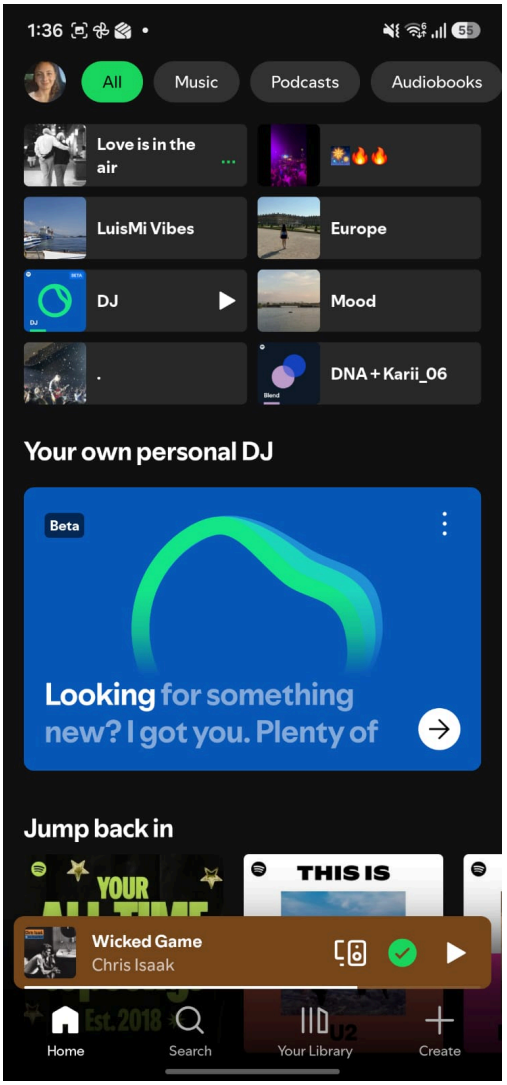

Implementation of the Internet of Things
Group: 502

Karime Martínez López - A01709690

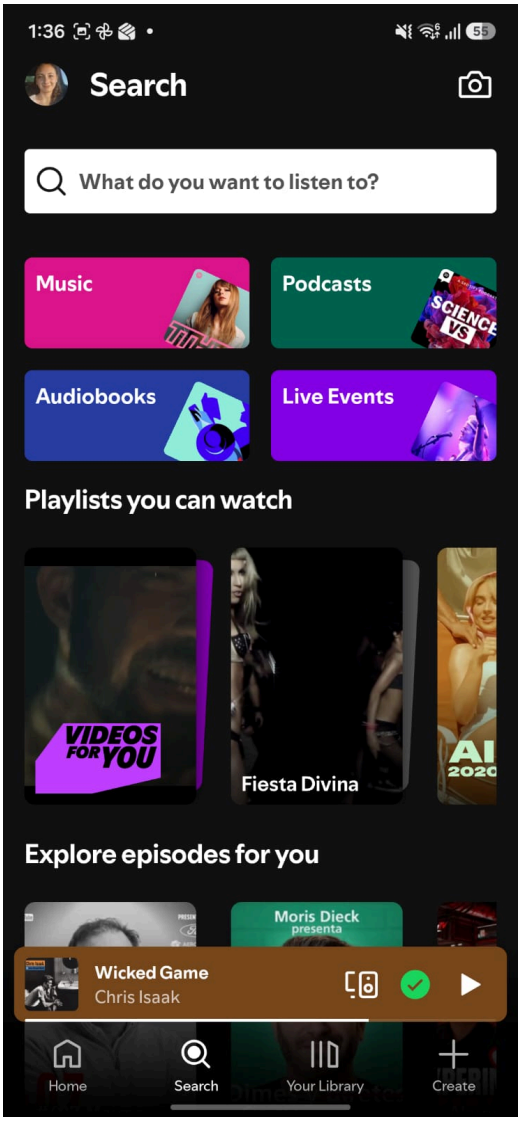

Fecha de entrega: 11/03/2026

Application chosen: Spotify
Feature: Saving a playlist. Spotify lets you save a playlist that another user has created in your library.

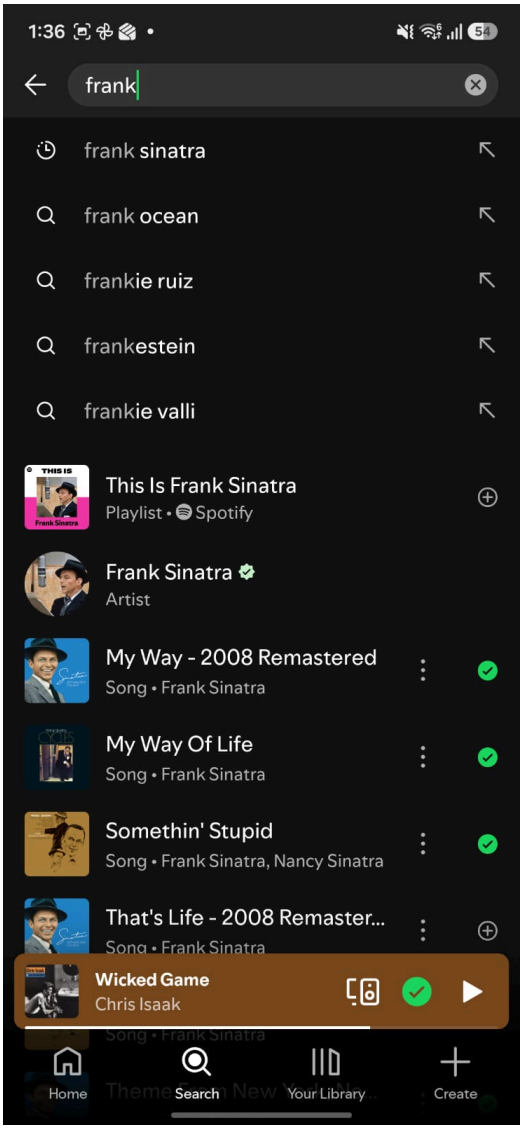

User flow

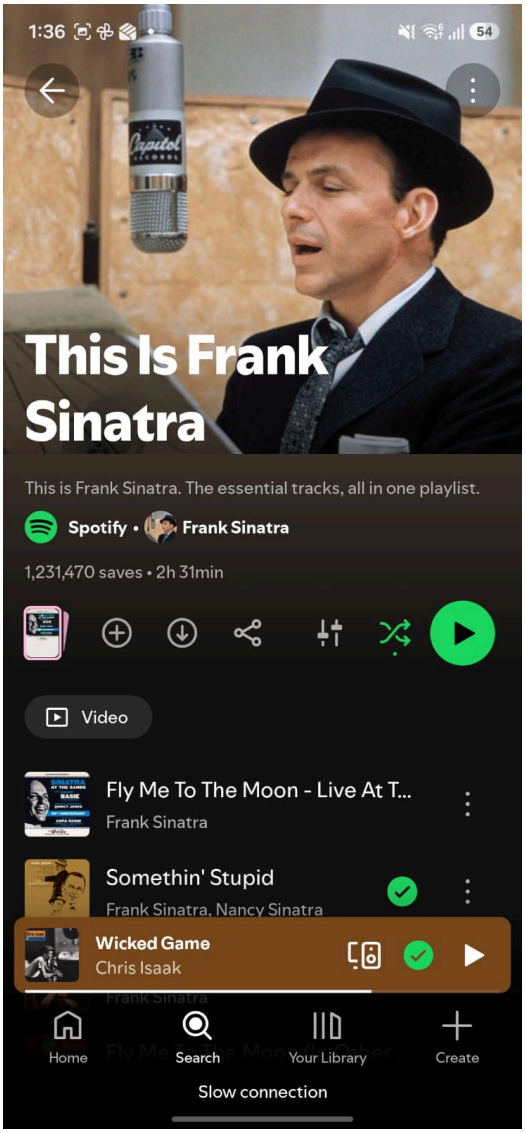

Open the spotify app

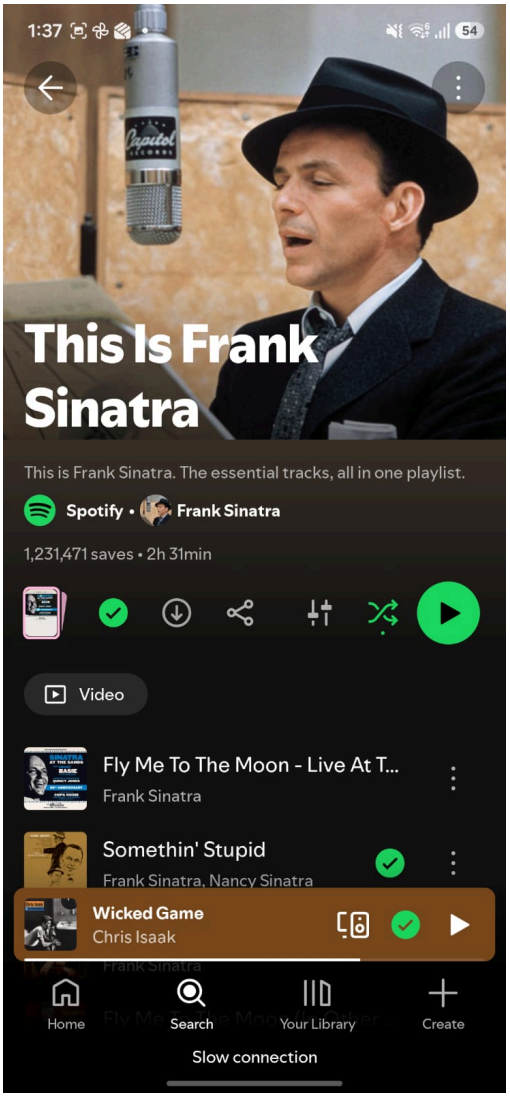

Select search

Search the playlist

Choose the playlist you're looking for

Select the icon ‘save’.

Experience Analysis

The user needs five steps to save a playlist in Spotify. The navigation is short and mostly clear since most of the buttons have a word or text explaining their action. Nonetheless, the feature of saving an already created playlist into the library is not easy to find. Choosing or searching for a playlist is easy but saving it can be confusing since there are many buttons available and the icon of this feature is not necessarily related to the word ‘save’.

Therefore, some people might have trouble identifying what that button is used for and avoiding using it at all. On another hand, the only visible change that shows the user that they have saved a playlist is the button turning green. If the person is already confused, he or her might have pressed it by accident and saved an unwanted playlist into their library without noticing.

Consequently, I consider that changing the icon or adding a text label will make its function clearer, not just for the button that is displayed once you select a playlist, but also to the one that is at the right of its name when searching for it.

Design proposal

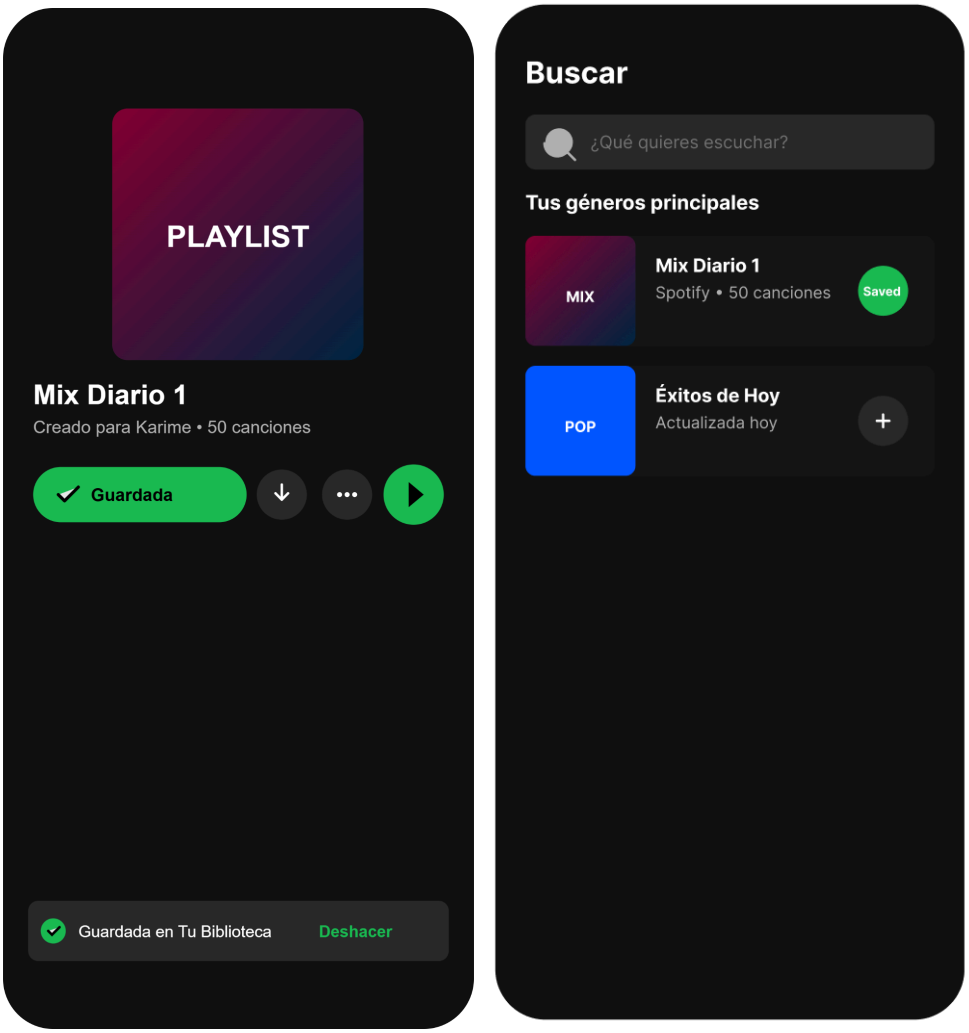

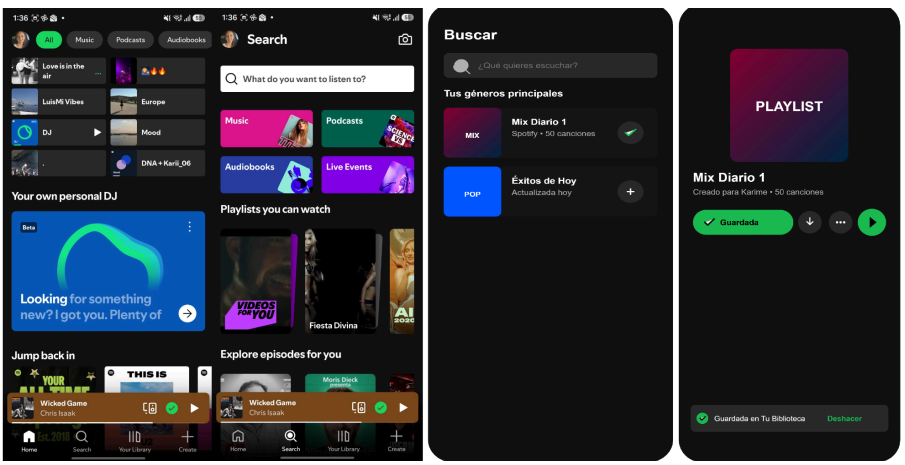

Image 1: the ‘save’ button has a label that clears its function. A message appears at the bottom of the screen that confirms the action or allows the user to undo it.

Image 2: A new label ‘saved’ is added to the button when searching for a playlist.

Proposed User Flow

Before and After Justification.

The process is the same as before, but there are three small changes. The first one is the difference in the button's icon, now it has a text label that indicates to the user that its function is to save the playlist. This change will avoid confusions and will likely increment the number of playlists saved, as more people will learn what that button is for.

The second one is that now a confirmation message pops up on the screen, so in case the user pressed the button accidentally it can just select the option 'undone'. Before, people could have saved a playlist by error and they wouldn't even notice unless they checked their library.

Finally, the last one is that a text label has been added to the button 'save' that is available in the search section, indicating that the user can also save a playlist from there, without having to enter it.

All these changes will contribute to the user experience by making it easier to save a playlist, especially to people who are not that familiar with the application.
